DragonFeast

For the project I was interested in involving myself in most parts of our process, as I didn't see anything as a particular strength of mine.

That being said I was quite interested in animation and 3D-Modeling as well as in conceptualising aspects of the game not only visually but also on the game design front.

I also intended to involve myself in coding, as it really is a skill I want to learn despite not enjoying it.

Week 1:

- conceptualised our game DragonFeast with the others
- started developing the base concepts of our combat system, whilst Justus thought up the special attacks and potential debuffs
- made first character concept art and animation concepts as a proof of concept for the rest of the group
- started to reason and write down design decisions in the GameDoc
- worked on the level with the others
- finished what would eventually become our final dragon design

Week 2:

- I further worked on the character design and further iterated on Harus Designs of the enemies
- fully finished designing the dragon
- made the dragons 3D-Model
- rigged the dragon
- made the UV of the dragon and made the first draft of his textures
- started animating the dragon
- finalised the enemy designs of the knight and the archer
- started work on the knight 3D-Model

Week 3:

- further animated the dragon
- finished the Knight model
- rigged the knight model and Björns archer model
- started animation on archer and knight
- implemented animations in Unity
- made some boss designs (gameplay and visuals)

Week 4:

- finished Animation on Archer and Knight and implemented those in Unity, accompanied by the implementation of their weapons
- further animating of the dragon
- rigged and fixed Björns repurposed Babydragon model
- worked on some “broken” 3D-models to ease their implementation in Unity
- worked out some kinks within the Unity project
- worked on the level segments in Unity

Week 5:

- made the final designs of the ballista boss
- made the boss and his ballista in 3D
- rigged and animated the boss
- further animating on the dragon
- textured the boss with Haru and afterwards implemented him in Unity
- started work on a shader and script that would allow the players to see the dragon hidden behind walls, by showing a sphere around him when he is too close to a wall
- made ragdolls for the enemies in Unity, utilizing new rigs made in blender due to the previous rigs leading to complications
- made a storyboard for a potential Introsequence for our Game
- worked on some key art for the project

Week 6:

- finished work on the earlier mentioned shader
- finished animation work on the dragon
- worked a bit on the UI
- made a raw draft of our Intro in animated form
- worked on bugs arising within the game
- worked on the very minimal balance we have in our game
- worked on implementing the shield feature
- helped with finishing up our documentation and analysis
- work on optimizing the games performance

Conclusion

I believe to have learned quite a bit during this project and feel that I have gotten the opportunity to work on everything I wanted, from conceptualising the game and designing characters to animating the final 3D-Models and implementing things in Code, I got to be involved in every facet of the game, be it in very minimal amounts as with the games sound design (an area I wasn't particularly interested in).

Whilst I don't believe my work to be comparable in quality to my peers, I believe to have tremendously benefited from working with them and learning from them, I at least believe to not have hindered them in their own work too much.

In summary I reckon to have learned quite a bit and was mostly able to work on everything I set out to work on, with coding being something I probably should have forced myself into a bit more.
